

Project Update: February 2013

This second update of Biodiversity Conservation through Piggery project is bringing news about the construction of the inspection chamber to collect all waste water from the pig unit as means of enabling mitigation of any risk that might come as a result of the piggery project in the area due high waste accumulated and being capable of polluting the environment and water in the downstream. This unit will in many ways contribute to increased yield per unit area of land within communities neighbouring this project through use of this manure accumulated at CIBC centre thus enabling resource recycling and flow.

In addition, the arrival of the first batch of feeds was registered a week ago, it has been a challenge having feeds for some good time due to lack of money, we hope to have increase in production because our pigs are enjoying quality feeds.
