

Project Update: April 2015

I have setup water system in the farm and I also started growing several kinds of vegetables such as; watermelons, red bean, black bean, garlics, onions which is including fruit trees. All of them have I grown by organic way and I use water for these vegetables from water tank that setup by the project.

Building toilet and water system

Now, I am starting to build a place for making natural compost and I will invite farmers who interest to produce alternative fertilizers to corroborate together.

Organic rice

I have harvested 3 types of organic rice as follow; Rice berry, Sticky rice and Red jasmine rice. I also started packing rice with vacuum system and sold to neighborhoods and other people who aware about organic rice.

I am mobilizing other farmers who grow rice nearby my rice field to be a group of organic farmer, for this point quite difficult because the product from my first crop I got just 60-70 % (compare with last crop) so, I have to explain about this for the farmers. So, I got less organic rice because of soil quality, the soil has been using with chemical fertilizers and pesticides and herbicides for long time. So I am strongly believe that next crop of organic rice will be better.

Left: Watering for vegetables. Right: Red jasmine organic rice (product).
