

## Project Update: January 2016

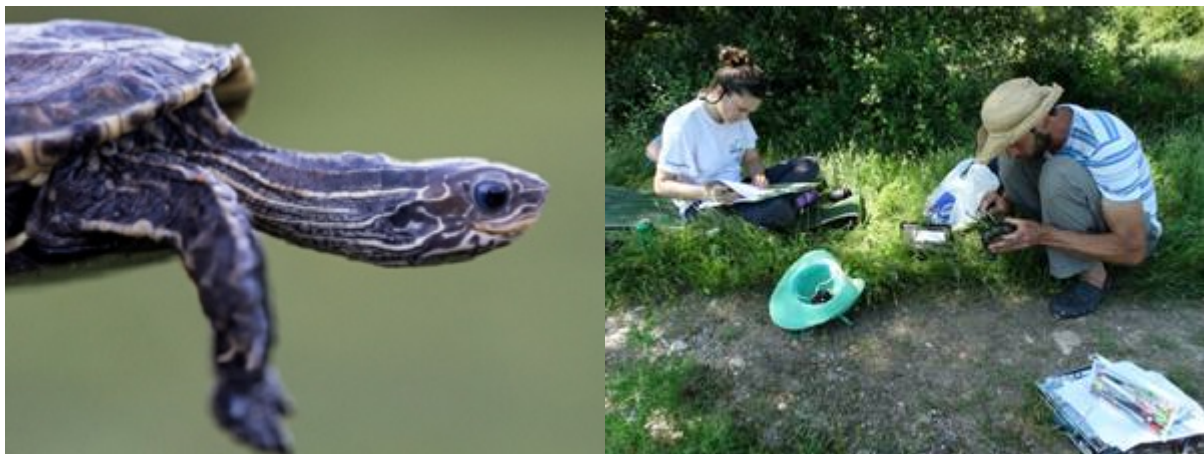

We managed to complete all fieldwork and we managed to catch the 98 individuals for whom we have done morphometric measures, determine the age category and took samples for DNA analysis.

We have confirmed the presence of Balkan terrapin at one new site - Ada Bojana, Ulcinj ( $41.862000^{\circ}$   $19.361000^{\circ}$ ).

We held lectures in primary schools in Herceg Novi and Kotor, and had meetings with local fishermen society.

We have held meetings with decision makers on local level and with Environmental Protection Agency and Ministry of Sustainable Development and Tourism where we presented the results of the project and initiated on common work.

We have done a project (<http://rivulata.drustvoekologa.me/en/o-projektu/>).

Left: Balkan terrapin. Right: Taking body mass and body measures of individuals that are caught.
