

## **Project Update: January 2017**

We finished the sampling the fishes in Krong No River in dry and rainy in 2016. We surveyed and also measured condition of water (pH, DO and temperature) in three different habitats of fish consisting of pool, running water and riffle currents in Krong No River. Total the fishes we collected including 15 species (57 specimens collected) of family Cyprinidae (10 species), Nemacheilidae (2 species), Balitoridae (1 species), Gyrinocheiridae (1 species) and Channidae (1 species). Fish composition of dry season is most similar to rainy season. Species of Cyprinidae and Channidae are recorded occurring in some small stream and deep pool from lower to upper Krong No River. Nemacheilidae and Balitoridae are recorded in running water and most of them present in small streams. We did not record any introduced species in this survey. Now, we are analysing morphologic and molecular data to write the final report within next month.

Mr. Hung (leader) with two cyprinids collected in the lower Krong No River
