

## Project Update: June 2016

From April-June 2016 we managed to gather all the necessary equipment for fieldwork and determination of samples under the stereo microscope. We plan to conduct our first two field trips (Tara and Golija mountains) in July 2016.

In these last months we held several lectures to public community and students of elementary schools and faculties.

(children and scientific) announcing presentations.

Two presentations to public were in the public library "Sveti Sava" in Belgrade (photo 1). The posters were hung at the library entrance and inside of two departments

Also, presentations and discussions about the importance of parasitoids were held in two elementary schools (photo 2).

Furthermore, with the help of kind people of Faculty of Agriculture in Belgrade, we presented our project in the beautiful and very popular outdoor garden that belongs to Faculty of Agriculture. The project was presented to the students of Biology and Agriculture and all other interested in this subject (photo 3).

After all the presentations, we can conclude that there is complete lack of knowledge about Aphid parasitoids (Aphidiinae) and their importance in all communities mentioned above.
