

Project Update: February 2017

In the last quarter of this project period I have used some of the platforms to educate and disseminate my research findings to the academicians, community stakeholders and schools. I made a presentation to the lecturers and students of College of Natural Resources as they are most of the time engaged in scientific research activities of our country. While presenting my research works, I specifically focused on the outcomes and recommendations of my project. It was a very interactive session.

I made a point to share my findings to the community people as they partake in grassroots decision making. They can impact the conservation of WBH and its nesting habitats from the influence of fire along with other relevant line agencies/institutions. One school in Chhubu Gewog, Punakha was identified. The students and teachers of the school were educated on the bird, its habitats and disturbances. All of participants were requested to be on board together in conserving this bird species and its habitats.
