

## Project Update: March 2016

As it is predicted by project timescale, during March 2016 we designed and produced high quality posters. They are placed in almost all fishing tackle stores on our coastline, also in ports and similar places. They show good results and we received big number of reports about blue shark catches and sightings during the past years. Local fishermen are interested in participation in the project activities. Due to that, we already collected an amount of data that will help us during the summer fieldwork. We designed educational leaflets, which we are distributing during lectures in schools. We have done introductory lecture about the project and its aims for the biology students. An article about the project has been published in national newspapers "Pobjeda". Also, people get informed about the project through "Montenegrin Ecologists Society" Facebook page.

Placed poster in "Megafish" tackle store
