

## **Project Update: December 2016**

A public awareness campaign for local communities and institutions was conducted. During the campaign, participants were educated on threatened status and conservation needs of Pallas's fish eagle (PFE). The outreach activities were targeted mainly to promote the conservation of PFE. Moreover, after returning to their homes, participants were asked to disseminate what they learned to their neighbours about the issue of PFE conservation.

The local community, developmental organisation, students and teachers were involved during the campaign.

The vegetation survey was carried out to determine type of habitat preferred by PFE. The survey plots were layout in the PFE nesting and roosting areas. A 10 m circular plot survey design was used to assess the vegetation.
