

Project Update: July 2017

I participated and presented a poster at the 3rd Island Invasives Conference, held from 10th - 14th July 2017 at the University of Dundee, UK. The study described in the poster explores how the local community's knowledge on invasive species can be used as a cost-effective survey technique. This is an outcome of rigorous field work undertaken for the Indian bullfrog project.

Overall, the project is on course to achieve its stated objectives, with completion of data collection for distribution, dispersal pathways, density, and trophic impact. The advocacy component of the project would soon be underway.
