

Project Update: April 2018

We finished field work for March. During March we caught 55 individuals of Balkan terrapin. We managed to catch the 55 individuals for whom we have done morphometric measures, determine the age category and took samples for DNA analysis. All individuals was returned to their habitat. These days we are finishing the fieldwork for April. By the end of April, we expect the caught about 100 individuals of Balkan terrapin.

During fieldwork, we noted certain irregularities (waste water and disturbance of river bed) that we reported to the inspection.

First photo: Captured individual of Balkan Terrapin.

Second photo: Jasko Lake, Budva. It is habitat of Balkan Terrapin, one of three locality where we work population's study of this species.
