

## Project Update: November 2017

During the first months of project we settled on field work in the Montenegrin and Albanian part of Cijevna River. We collected bryological material from all substrates (rocks, soil, trees), and material was packed in paper bags. We collected around 100 different moss species. Material is temporarily stored in a herbarium and prepared for the determination part of project. During the fieldwork we also noticed the anthropogenic influences on the Cijevna River such as sand exploitation and the inflow of communal water into the river.
