

Project Update: May 2019

Our second year field session has successfully started, in May 2019 we visited all three selected Ramsar sites, Gornje podunavlje, Zasavica and Labudovo okno.

On the very start we very were worried, because of a long dry period, but the rain came, and we are having rainy and not very warm May. Still, in Zasavica area stoneworts were not found in the beginning of May, so we are hoping for better results in June. Diversity detected in Gornje Podunavlje and Labudovo okno wasn't very rich, but few stonewort species were there. In June 2018, typical vernal species *Nitella capillaris* was detected in Gornje podunavlje.

Zasavica field session May 2019

Labudovo okno field session May 2019

Gornje podunavlje field session May 2019

As always, we have to highlight that that we had very good cooperation with the protected area managers in each area, they showed interest in helping us to conduct our surveys and promote our results.
