

Project Update: January 2020

To this day we have developed different activities focused on agro-ecological conversion and knowledge of wildlife in the area. With the community the terraces for the crops in each of the five benefited farms and the respective knowledge dialogues focused on understanding the dynamics of the soil and its components were made.

Additionally, the programme of the bee keeper network was launched, where the first participants were the beneficiaries of this project, which are in the process of learning the development of practices and technologies friendly to the environment and the health of the community. Parallel to this, the native seeds that will be sown in the orchards of each of the beneficiaries have been acquired. These have been acquired through the Seed Guardians Network of Colombia.

Finally, parallel activities have been developed, focused on sensitising the non-expert public on the importance of biodiversity and pollinators, with emphasis on native bees, through conversations, knowledge dialogues and tastings of native honey bees.
