

Project Update: June 2023

All activities are running well so far. We have five linear transects where we conduct animal surveys, phenological monitoring, and environmental parameter surveys. Each transect has been visited four times until now. We frequently encounter some species, such as *Indri indri*, *Varecia variegata*, and *Haplemur griseus*.

We continue to collect data in the field, and I will send you updates as long as the fieldwork and research progress.
