

Update Project: August 2020

During the project, we have collaborated with Misool Foundation and Indonesia Manta Project that are based in the Savu Sea area to collect the samples from three different locations, Nangalili, Solor, and Rote. Then we have contacted Mr Lumban, who has been working as a lecturer in Nusa Cendana University, to discuss the opportunity to give a workshop or webinar (under COVID-19 restriction) about "conservation elasmobranch statue and issue including *Mobula mobular* in Savu Sea". Also, we have been starting our lab processing with microsatellite technique; the lab process has been conducting in Biodiversitas Indonesia (BIONESIA) lab in Denpasar, Bali.

Figure 1. A fisherman from Rote Island (Indonesia Manta Project Team's) found *Mobula mobular* from bycatch.

Figure 2. We process our sample to do microsatellite technique in BIONESIA lab.
