

## Project Update: June 2006

### Activities in 2006 March - July

The species assessments have been carried out for identifying the threatened plant and animal species, and for identifying the major human impacts.

GPS measurements were made, and the borders of the areas have been identified.

Although many of our results have not been interpreted yet, we are going to make the first presentation about our conservation plans and previous results in the VIII European Congress of Entomology in Ismir, Turkey in 17-22 September 2006. Our abstract is under revision.

Top to bottom: Balea Lake; The team; Insect studies; *Saxifraga demissa*; *Primula minima*; *Saxifraga oppositifolia* & *Carabus*.
